

13-week liquidity review

Collections timing, capital deferral and contingency funding

Synthetic portfolio analysis. Recommendations are proposed; no employer outcomes are claimed.

Decision requested

Establish a \$175,000 stressed liquidity contingency before receipts are delayed. If eligible collections can be accelerated and capex deferred, the model reduces the peak requirement to \$105,000; funding is still needed and is not assumed available.

Financial case

Base cash bottoms at \$119,000 against a \$100,000 floor. A two-week collection delay produces a \$75,000 negative cash trough. Mitigation raises the trough to a \$5,000 deficit but does not restore the floor. Deferring \$90,000 capex to week 14 creates a future obligation, not a saving.

Case	Lowest cash	Peak funding gap	Week 13 cash
Base	\$119,000	\$0	\$149,000
Delayed receipts	(\$75,000)	\$175,000	(\$45,000)
Mitigation	(\$5,000)	\$105,000	\$45,000

Tradeoffs and alternatives

Collections require customer coordination and may affect relationships. Capex deferral can increase operational risk. Supplier payments stay scheduled; the case does not assume unilateral late payment. Any credit facility needs lender confirmation and covenant review.

Approval and execution

Conditions before approval

Reconcile opening bank cash and all 26 invoices. Validate receipt dates with AR and customers, and the impact of deferred capex with Operations. Confirm a committed financing source before relying on the funding gap as covered.

Proposed owner	Timing	Required action
Treasury + AR	Day 1	Reconcile bank and invoice opening balances
AR + Account lead	Week 2	Confirm and collect eligible overdue invoices
Operations + Finance	Before week 6	Approve capex deferral with operational review
Treasury	Before floor breach	Confirm liquidity contingency and covenants
Treasury + AP	Every Monday	Reconcile actuals and refresh forecast

Post-decision review

The following observations are a separate synthetic review exercise. They demonstrate follow-through without claiming realized results.

Week	Receipt variance	Payment variance	Net cash variance
1	(\$10,000)	\$2,000	(\$12,000)
2	\$5,000	(\$1,000)	\$6,000
3	\$0	\$0	\$0
4	(\$5,000)	\$1,000	(\$6,000)

Model basis and review

Calculation method

Direct weekly receipts less payments, with opening cash rolled to ending cash for 13 weeks starting October 5, 2026. Each invoice is collected once or carried beyond the horizon. Direct cash sales are separate from opening AR. Receipt acceleration applies only to the designated \$194,000 overdue queue.

Material limitations

The delayed and mitigation cases retain \$194,000 uncollected at week 13. The mitigation case also carries \$90,000 capex into week 14. No bank facility, financing interest, bad-debt write-off, new credit invoices, tax disbursements or foreign exchange is assumed. Negative cash identifies a funding need, not an executable operating plan.

Scenario capture and refresh

The comparison uses three sequential recalculations of one active Excel build, captured October 3, 2026. Change Assumptions D5 to select a case. Recalculate in Excel and refresh comparisons after changing inputs; PDF figures are a dated snapshot.

Ownership represented

Quincy Jones designed the analysis, built the model and controls, evaluated alternatives, and authored the decision and monitoring workflow. Proposed corporate owners are roles inside the case, not positions held by Quincy.

Forensic review

Independent calculations, reconciliation checks and input-change tests were completed before publication. The downloadable audit explains scope and engine limitations. Artifact-tool recalculation and exported caches were checked; desktop Excel was not available for an application-level test.
