

Valuation decision brief

Market snapshot: September 29, 2026. Presentation reviewed: October 3, 2026 (UTC).

Decision view

The operating case implies \$149.96 per proxy share against a \$226.07 dated price snapshot (33.7% below that price). Use this case to discuss margin recovery, equipment spending and discount-rate sensitivity. This is an independent portfolio estimate, not company guidance or a buy/sell recommendation.

Measure	Reviewed base case
PV of 2026E–2030E cash flows	\$3,141.48 million
PV of terminal value	\$12,545.72 million
Enterprise value	\$15,687.20 million
Equity value after debt / cash	\$14,237.69 million
Market-implied share proxy	94.944 million
Value per proxy share	\$149.96

Method and judgment

Five end-year unlevered cash flows are discounted at 8.0% WACC. Terminal growth is 2.5%. The enterprise-to-equity bridge subtracts \$1,466.797 million debt and adds \$17.284 million cash. About 80% of modeled enterprise value comes from discounted terminal value, so terminal assumptions materially affect the conclusion.

Corrections and limitations

The workbook now distinguishes undiscounted terminal value (\$18,433.78 million) from enterprise value. Shares are a proxy implied from dated market capitalization / price, held flat; they are not verified fully diluted shares or FY2025 weighted-average EPS shares. Verify an appropriate share basis, current filings and market data before decision use. Forecasts simplify working capital, debt, other assets / liabilities and taxes.

Sources and authorship

Supplied model sources: SEC Companyfacts; J.B. Hunt FY2025 Form 10-K; peer filings; dated market snapshot. Completed CFI valuation coursework informed the methods; no CFI designation or certificate award is asserted. Quincy Jones authored this independent portfolio case. Review the downloadable forensic audit for verification scope.
