

Invoice exceptions and cash control

New synthetic portfolio analysis | October 3, 2026

Decision requested

Route confirmed duplicate repeats to payment-status review; hold unresolved unpaid control exceptions until supporting evidence is obtained. Do not book the gross review queue as savings or recovery.

Financial case

Across 700 generated invoice postings, 121 require review with gross non-overlapping value \$187,208. Paid confirmed duplicate repeats have \$4,782 potential recovery, and unpaid confirmed repeats have \$7,006 potential avoidance. Realized recovery is \$0. These categories are not additive to the gross review queue.

Queue	Records / basis	Value
Gross unique review	121	\$187,208
Unpaid review	All unpaid flagged postings	\$128,781
Paid confirmed repeat	Subset; potential recovery	\$4,782
Unpaid confirmed repeat	Subset; potential avoidance	\$7,006
Realized recovery	No real action performed	\$0

Tradeoffs and conditions

Matching identifiers creates a candidate, not proof. Synthetic evidence confirms ten repeated postings, clears five installment groups, and leaves five groups unresolved. Original confirmed postings are cleared from duplicate review. Missing POs and receipt evidence are not automatically losses. Supplier consent and collection success remain untested.

Execution and verification

Proposed corporate owners are simulation roles, not positions held by Quincy. All actions begin as Proposed.

Owner	When	Required action
AP reviewer	Day 1	Reconcile all 700 postings and identify repeat versus original
AP + Procurement	Days 1-3	Obtain PO/receipt evidence for unpaid exceptions
Controller	Before action	Approve duplicate decisions and accounting treatment
Supplier relations	After approval	Request credit for paid confirmed repeat; record response
Finance lead	Weekly	Reconcile credits/cash before recognizing realized recovery

Calculation method

Record IDs identify each posting. Duplicate matching uses supplier, invoice number and exact cents; separate synthetic evidence determines review outcome. Missing receipt evidence remains unresolved. Each flagged posting is allocated once using a primary-category hierarchy. Recovery candidates include only paid confirmed repeats; unpaid confirmed repeats are separately identified. Gross review value is workload, not a loss estimate.

Forensic review

1,197 record, population, reconciliation and SQL/Python checks passed across the two cases. Source data, review evidence and full source code are provided. These checks establish consistency of generated records; they do not validate real customers, supplier claims or realized outcomes.

Follow-up

Compare actual source records and approved decisions to the modeled baseline at the next review. Record the evidence and responsible reviewer before changing an action status. No realized savings or recoveries are claimed.
