

26-week liquidity and funding

Invoice collections, deferred capex and hypothetical revolver

Synthetic portfolio analysis. Recommendations are proposed; no employer outcomes are claimed.

Decision requested

Validate availability of a liquidity facility before relying on funded cash. Delayed receipts require peak debt of \$105,247; collection mitigation does not eliminate that peak.

Financial case

Minimum funded cash is \$178,981 in base and \$100,000 in delayed/mitigation cases. Delayed receipts need \$105,247 peak hypothetical debt. Base week-26 cash is \$1,160,500, driven materially by the added \$92,000 weekly credit-billings assumption.

Case	Min funded cash	Peak debt	Week-26 cash
Base	\$178,981	\$0	\$1,160,500
Delayed receipts	\$100,000	\$105,247	\$975,978
Mitigation	\$100,000	\$105,247	\$976,138

Tradeoffs and alternatives

Mitigation lowers modeled funding fees but leaves the earliest peak debt unchanged. Week-14 capex is paid inside the 26-week horizon. The high ending cash depends on new weekly credit billings and must not be portrayed as a realized collection improvement.

Approval and execution

Conditions before approval

Confirm bank/AR balances and customer promises, separate cash sales from new credit invoices, validate billings and payment timing, and confirm an actual facility with terms/covenants before relying on it.

Proposed owner	Timing	Required action
Treasury + AR	Day 1	Reconcile bank and invoice opening balances
AR + Account lead	Week 2	Confirm and collect eligible overdue invoices
Operations + Finance	Before week 6	Approve capex deferral with operational review
Treasury	Before floor breach	Confirm liquidity contingency and covenants
Treasury + AP	Every Monday	Reconcile actuals and refresh forecast

Post-decision review

The following observations are a separate synthetic review exercise. They demonstrate follow-through without claiming realized results.

Week	Receipt variance	Payment variance	Net cash variance
1	(\$10,000)	\$2,000	(\$12,000)
2	\$5,000	(\$1,000)	\$6,000
3	\$0	\$0	\$0
4	(\$5,000)	\$1,000	(\$6,000)

Model basis and review

Calculation method

The 26-week model combines opening invoices, separately issued new credit invoices, direct cash sales and dated payments. Revolver flows follow cash needs and the proposed cash floor; opening debt determines interest and unused commitment fees.

Material limitations

no bank underwriting, covenant package, vendor financing or real customer behavior is established. Interest uses opening weekly debt, with a simplified annual-rate/52 convention. The undrawn commitment fee is modeled explicitly. With no facility, the delay case exposes a funding shortfall rather than concealing it.

Scenario capture and refresh

The comparison uses three sequential recalculations of one active Excel build, captured October 3, 2026. Change Assumptions D5 to select a case. Recalculate in Excel and refresh comparisons after changing inputs; PDF figures are a dated snapshot.

Ownership represented

Quincy Jones developed this independent portfolio analysis with AI assistance. The package includes the model, controls, alternatives and proposed decision workflow. Proposed corporate owners are roles inside the case, not positions held by Quincy.

Forensic review

Independent calculations, reconciliation checks and input-change tests were completed before publication. The downloadable audit explains scope and engine limitations. Artifact-tool input edits and exported caches were checked. A second LibreOffice engine reproduced 2,134 numeric base-case formula caches. Desktop Microsoft Excel was not available; compatibility testing is limited to the stated engines.
